The car is now back from WRE having checked all the chassis over. In the end the problem was a very bent axle casing which Jon has now heavily braced to stop it happening again. We've also installed some new Hi Spec rear calipers as the new wheels would have fouled the old ones.

The transmission has had a new carrier and input shaft put in along with fresh SFI tags. I'm still waiting for the last little bits for the engine to put it all back together so we can ship the car back to Altiss, so Nigel can get on with new intercooler cores that have arrived from ARE cooling in OZ. He's also fabricating a new fuel tank and water tank whilst it's there....

We've also had the exhaust manifold coated at Zircotec to match the turbo housings we had done late last year. They have made an excellent job of them too. I'd highly recommend anyone with a high temp application to get the hot parts coated.....

More news soon with pics. ANDY.
